

**BCGOLD CORP. ACQUIRES RAIN AND WITCH PROPERTIES
NEAR MT. MILLIGAN COPPER-GOLD DEPOSIT,
CENTRAL BRITISH COLUMBIA**

Vancouver, BC – November 15, 2007 - BCGold Corp. ("BCGold" or "the Company") is pleased to announce it has acquired 100% interest in the 986 hectare Rain Properties and the 1,957 hectare Witch Property, neighbouring the Mt. Milligan Cu-Au deposit 155 kilometres northwest of Prince George in central British Columbia, Canada. (Figure1). The properties were acquired through BCGold's generative exploration efforts.

The Rain Properties are situated 5 kilometres south of the Mt. Milligan porphyry copper-gold deposit, which has measured and indicated resources totalling 417.1 million tonnes grading 0.21% Cu and 0.41 g/t Au, or 1.9 billion pounds of contained copper and 5.5 million ounces contained gold (see Terrane Metals Corp. press release dated August 21, 2007). The properties are strategically located within Terrane's Mt. Milligan mineral titles block and are accessed by the main service roads to Mt. Milligan from Fort St. James, B.C.

The Rain Properties were staked subsequent to a review of regional airborne geophysics and assessment reports in the Mt Milligan area, which indicated the potential for epithermal gold and porphyry-style copper-gold mineralization in an area largely unexplored. One known epithermal gold occurrence (MinFile 093N 205) is located on the property. The area was last worked by BP Minerals Limited in 1988.

The Rain Properties are located on topographic highs underlain by Takla Group volcanics. A government sponsored Mount Milligan Airborne Geophysical Survey (GSC Open File 2535) shows a high potassium and low equivalent thorium/potassium radiometric response in the area of the Rain properties, suggesting the presence of a broad hydrothermal alteration system possibly associated with a concealed porphyry copper-gold deposit.

The Company also acquired 100% interest in the Witch Property, situated immediately south of Witch Lake and 15 kilometres west of Mt. Milligan. The property was staked over the Witch occurrence locality (Minfile 093-164), encompassing a large (3 by 5 kilometre) irregular alteration system characterized by widespread biotite hornfelsing and patchy, but often strong potassic and propylitic alteration. Volcanic rocks of the Upper Triassic Witch Lake Formation (Takla Group) are intruded by coeval Takla Group intrusive equivalents consisting of crowded plagioclase porphyritic monzonite and monzonite intrusive breccias. The property area has previously been explored for porphyry copper-gold mineralization by Westmin Resources Ltd, Noranda Mining and others in the 1980s. Exploration work consisted of soil geochemistry, ground geophysics, trenching and limited diamond drilling. In 2008 the Company intends to initiate an exploration program on the Rain and Witch properties which may include ground geophysical and geochemical surveys to define drill targets.

The Rain and Witch Properties acquisition articulates BCGold’s generative exploration strategy, focusing on acquiring and advancing conceptual, early and mid-stage, quality exploration opportunities towards resource development utilizing internal expertise and by engaging preferred joint venture partners.

On behalf of the Board of Directors,
 Brian P. Fowler, P. Geo.
 President & CEO
