

Stealth Minerals Ltd.

Sickle-Sofia Property Work Program

Stealth Minerals Ltd.'s ("Stealth") interest in the area was based on an anomalous BC Government RGS silt sample (1997, 47 ppb Au). Stealth's exploration efforts from 1999 to 2006 have shown that potential exists in the Toodoggone region for large tonnage copper-gold porphyry and transitional porphyry-epithermal deposits.

A summary of Stealth's work on this property includes:

2006

- Expanded the I.P./ground magnetic survey by another 21 line-kilometres and expanded the chargeability anomaly a further 600 metres north and 300 metres west.

2005

- 21 line-km of 200 metre line-spaced I.P. and ground magnetic geophysical survey completed over the lower, covered portion of the Sofia copper-gold porphyry target. This survey outlined an 800 metre wide by 1,200 metre long +40 millisecond I.P. chargeability anomaly that was open to the north.

2004

- Staking of additional claims.
- 27 square kilometre gridded soil survey defined the Alexandra copper-gold soil anomaly.
- Prospecting discovered the Sofia porphyry outcrop, the North Vein outcrop, and high-sulphidation silica-alunite alteration.
- 3,323 metres of diamond drilling completed in 24 holes, testing down dip and along strike of the Quartz Lake A to C veins and test the along strike projection of the Griz-Sickle vein set.

2003

- Discovery of Sickle Creek, Griz and Quartz Lake veins.
- Multi-parameter helicopter-borne geophysical survey flown as part of a Private-Public-Partnership (PPP) with the Geological Survey of Canada and the British Columbia Department of Mines and Energy.

2000

- Limited prospecting on JC 1-2 claims. Discovery of quartz and quartz-carbonate veins ranging from 0.5 - 50 centimetres in width with anomalous precious metals values and chalcopyrite, sphalerite and galena mineralization.

1999

- Initial claims staked.
- Small scale geochemistry program completed.
